100 numpy exercises This is a collection of exercises that have been collected in the numpy mailing list, on stack overflow and in the numpy documentation. The goal of this collection is to offer a quick reference for both old and new users but also to provide a set of exercices for those who teach. If you find an error or think you've a better way to solve some of them, feel free to open an issue at https://github.com/rougier/numpy-100	Question: 1. Import the numpy package under the name `np` (★☆☆)	Question: 2. Print the numpy version and the configuration (★☆☆)
Question: 3. Create a null vector of size 10 (★☆☆)	Question: 4. How to find the memory size of any array (★☆☆)	Question: 5. How to get the documentation of the numpy add function from the command line? (★☆☆)
Question: 6. Create a null vector of size 10 but the fifth value which is 1 (★☆☆)	Question: 7. Create a vector with values ranging from 10 to 49 (★☆☆)	Question: 8. Reverse a vector (first element becomes last) (★☆☆)

Answer 2:	Answer 1:	
<pre>print(npversion) np.show_config()</pre>	import numpy as np	
Answer 5:	Answer 4:	Answer 3:
%run `python -c "import numpy; numpy.info(numpy.add)"Z = np.zeros((10,10)) print("%d bytes" % (Z.size * Z.itemsize))	<pre>Z = np.zeros(10) print(Z)</pre>
Answer 8:	Answer 7:	Answer 6:
<pre>Z = np.arange(50) Z = Z[::-1]</pre>	<pre>Z = np.arange(10,50) print(Z)</pre>	<pre>Z = np.zeros(10) Z[4] = 1 print(Z)</pre>
print(Z)		print(Z)

Question:	Question:	Question:
9. Create a 3x3 matrix with values ranging from 0 to 8 (★☆☆)	10. Find indices of non-zero elements from [1,2,0,0,4,0] (★☆☆)	11. Create a 3x3 identity matrix (★☆☆)
Question:	Question:	Question:
12. Create a 3x3x3 array with random values (★☆☆)	13. Create a $10x10$ array with random values and find the minimum and maximum values $(\star $	14. Create a random vector of size 30 and find the mean value (★☆☆)
Question: 15. Create a 2d array with 1 on the border and 0 inside (★☆☆)	Question: 16. How to add a border (filled with 0's) around an existing array? (★☆☆)	Question: 17. What is the result of the following expression? (★☆☆)

Answer 11:	Answer 10:	Answer 9:
<pre>Z = np.eye(3) print(Z)</pre>	<pre>nz = np.nonzero([1,2,0,0,4,0]) print(nz)</pre>	<pre>Z = np.arange(9).reshape(3,3) print(Z)</pre>
Answer 14:	Answer 13:	Answer 12:
<pre>Z = np.random.random(30) m = Z.mean() print(m)</pre>	<pre>Z = np.random.random((10,10)) Zmin, Zmax = Z.min(), Z.max() print(Zmin, Zmax)</pre>	<pre>Z = np.random.random((3,3,3)) print(Z)</pre>
Answer 17:	Answer 16:	Answer 15:
<pre>print(0 * np.nan) print(np.nan == np.nan) print(np.inf > np.nan) print(np.nan - np.nan) print(0.3 == 3 * 0.1)</pre>	<pre>Z = np.ones((5,5)) Z = np.pad(Z, pad_width=1, mode='constant', constant print(Z)</pre>	Z = np.ones((10,10)) t_₹10es-0)-1] = 0 print(Z)

Question: 18. Create a 5x5 matrix with values 1,2,3,4 just below the diagonal (★☆☆)	Question: 19. Create a 8x8 matrix and fill it with a checkerboard pattern (★☆☆)	Question: 20. Consider a (6,7,8) shape array, what is the index (x,y,z) of the 100th element?
Question: 21. Create a checkerboard 8x8 matrix using the tile function (★☆☆)	Question: 22. Normalize a 5x5 random matrix (★☆☆)	Question: 23. Create a custom dtype that describes a color as four unisgned bytes (RGBA) (★☆☆)
Question: 24. Multiply a 5x3 matrix by a 3x2 matrix (real matrix product) (★☆☆)	Question: 25. Given a 1D array, negate all elements which are between 3 and 8, in place. (★☆☆)	Question: 26. What is the output of the following script? (★☆☆)

Answer 20:	Answer 19:	Answer 18:
<pre>print(np.unravel_index(100,(6,7,8)))</pre>	<pre>Z = np.zeros((8,8),dtype=int) Z[1::2,::2] = 1 Z[::2,1::2] = 1 print(Z)</pre>	<pre>Z = np.diag(1+np.arange(4),k=-1) print(Z)</pre>
Answer 23:	Answer 22:	Answer 21:
<pre>color = np.dtype([("r", np.ubyte, 1),</pre>	<pre>Z = np.random.random((5,5)) Zmax, Zmin = Z.max(), Z.min() Z = (Z - Zmin)/(Zmax - Zmin) print(Z)</pre>	<pre>Z = np.tile(np.array([[0,1],[1,0]]), (4,4)) print(Z)</pre>
Answer 26:	Answer 25:	Answer 24:
<pre># Author: Jake VanderPlas print(sum(range(5),-1)) from numpy import * print(sum(range(5),-1))</pre>	# Author: Evgeni Burovski Z = np.arange(11) Z[(3 < Z) & (Z <= 8)] *= -1 print(Z)	<pre>Z = np.dot(np.ones((5,3)), np.ones((3,2))) print(Z) # Alternative solution, in Python 3.5 and above Z = np.ones((5,3)) @ np.ones((3,2)) print(Z)</pre>
	p. 2.10(2)	

Question: 27. Consider an integer vector Z, which of these expressions are legal? (★☆☆)	Question: 28. What are the result of the following expressions?	Question: 29. How to round away from zero a float array ? (★☆☆)
Question: 30. How to find common values between two arrays? (★☆☆)	Question: 31. How to ignore all numpy warnings (not recommended)? (★☆☆)	Question: 32. Is the following expressions true? (★☆☆)
Question: 33. How to get the dates of yesterday, today and tomorrow? $(\bigstar \overleftrightarrow{a} \overleftrightarrow{a})$	Question: 34. How to get all the dates corresponding to the month of July 2016? (★★☆)	Question: 35. How to compute ((A+B)*(-A/2)) in place (without copy)? (★★☆)

Answer 29:	Answer 28:	Answer 27:
<pre># Author: Charles R Harris Z = np.random.uniform(-10,+10,10) print (np.copysign(np.ceil(np.abs(Z)), Z))</pre>	<pre>print(np.array(0) / np.array(0)) print(np.array(0) // np.array(0)) print(np.array([np.nan]).astype(int).astype(float))</pre>	Z**Z 2 << Z >>> 2 Z <- Z 1j*Z Z/1/1 Z <z>Z</z>
Answer 32:	Answer 31:	Answer 30:
<pre>with np.errstate(divide='ignore'): Z = np.ones(1) / 0</pre>	<pre># Suicide mode on defaults = np.seterr(all="ignore") Z = np.ones(1) / 0 # Back to sanity _ = np.seterr(**defaults)</pre>	<pre>Z1 = np.random.randint(0,10,10) Z2 = np.random.randint(0,10,10) print(np.intersect1d(Z1,Z2))</pre>
Answer 35:	Answer 34:	Answer 33:
<pre>Z = np.arange('2016-07', '2016-08', dtype='datetime' print(Z)</pre>	64 PBt rday = np.datetime64('today', 'D') - np.timede: today = np.datetime64('today', 'D') tomorrow = np.datetime64('today', 'D') + np.timede:	

Question:	Question:	Question:
36. Extract the integer part of a random array using 5 different methods (★★☆)	37. Create a 5x5 matrix with row values ranging from 0 to 4 (★★☆)	38. Consider a generator function that generates 10 integers and use it to build an array ($\star \Leftrightarrow \Leftrightarrow$)
Question: 39. Create a vector of size 10 with values ranging from 0 to 1, both excluded (★★☆)	Question: 40. Create a random vector of size 10 and sort it (★★☆)	Question: 41. How to sum a small array faster than np.sum? (★★☆)
Question: 42. Consider two random array A anb B, check if they are equal (★★☆)	Question: 43. Make an array immutable (read-only) (★★☆)	Question: 44. Consider a random 10x2 matrix representing cartesian coordinates, convert them to polar coordinates (★★☆)

Answer 38:	Answer 37:	Answer 36:
<pre>Z = np.zeros((5,5)) Z += np.arange(5) print(Z)</pre>	<pre>Z = np.random.uniform(0,10,10) print (Z - Z%1) print (np.floor(Z)) print (np.ceil(Z)-1) print (Z.astype(int)) print (np.trunc(Z))</pre>	<pre>A = np.ones(3)*1 B = np.ones(3)*2 C = np.ones(3)*3 np.add(A,B,out=B) np.divide(A,2,out=A) np.negative(A,out=A) np.multiply(A,B,out=A)</pre>
Answer 41:	Answer 40:	Answer 39:
<pre>Z = np.random.random(10) Z.sort() print(Z)</pre>	<pre>Z = np.linspace(0,1,12,endpoint=True)[1:-1] print(Z)</pre>	<pre>def generate(): for x in range(10): yield x Z = np.fromiter(generate(),dtype=float,count=-1) print(Z)</pre>
Answer 44:	Answer 43:	Answer 42:
<pre>Z = np.zeros(10) Z.flags.writeable = False Z[0] = 1</pre>	A = np.random.randint(0,2,5) B = np.random.randint(0,2,5) # Assuming identical shape of the arrays and a tole equal = np.allclose(A,B) print(equal) # Checking both the shape and the element values, nequal = np.array_equal(A,B) print(equal)	

Question:	Question:	Question:
45. Create random vector of size 10 and replace the maximum value by 0 (★★☆)	46. Create a structured array with `x` and `y` coordinates covering the [0,1]x[0,1] area (★★☆)	47. Given two arrays, X and Y, construct the Cauchy matrix C (Cij =1/(xi - yj))
Question:	Question:	Question:
48. Print the minimum and maximum representable value for each numpy scalar type (★★☆)	49. How to print all the values of an array? (★★☆)	50. How to find the closest value (to a given scalar) in an array? (★★☆)
Question: 51. Create a structured array representing a position (x,y) and a color (r,g,b) $(\star\star)$	Question: 52. Consider a random vector with shape (100,2) representing coordinates, find point by point distances (★★☆)	Question: 53. How to convert a float (32 bits) array into an integer (32 bits) in place?

```
Answer 47:
                                                     Answer 46:
                                                                                                          Answer 45:
Z = np.zeros((5,5), [('x',float),('y',float)])
                                                                                                          Z = np.random.random((10,2))
                                                     Z = np.random.random(10)
Z['x'], Z['y'] = np.meshgrid(np.linspace(0,1,5), np.linspace(0,1,5))
                                                    Z[Z.argmax()] = 0
                                                                                                          X,Y = Z[:,0], Z[:,1]
                                                     print(Z)
                                                                                                          R = np.sqrt(X**2+Y**2)
print(Z)
                                                                                                          T = np.arctan2(Y,X)
                                                                                                          print(R)
                                                                                                          print(T)
Answer 50:
                                                     Answer 49:
                                                                                                          Answer 48:
np.set_printoptions(threshold=np.nan)
                                                     for dtype in [np.int8, np.int32, np.int64]:
                                                                                                          # Author: Evgeni Burovski
Z = np.zeros((16,16))
                                                        print(np.iinfo(dtype).min)
print(Z)
                                                        print(np.iinfo(dtype).max)
                                                                                                          X = np.arange(8)
                                                                                                          Y = X + 0.5
                                                     for dtype in [np.float32, np.float64]:
                                                        print(np.finfo(dtype).min)
                                                                                                          C = 1.0 / np.subtract.outer(X, Y)
                                                        print(np.finfo(dtype).max)
                                                                                                          print(np.linalg.det(C))
                                                        print(np.finfo(dtype).eps)
Answer 53:
                                                     Answer 52:
                                                                                                          Answer 51:
                                                    Z = np.random.random((10,2))
X,Y = np.atleast_2d(Z[:,0], Z[:,1])
D = np.sqrt((X-X.T)**2 + (Y-Y.T)**2)
print(D)
# Much faster with scipy
import scipy
                                                     print(Z)
# Thanks Gavin Heverly-Coulson (#issue 1)
import scipy.spatial
Z = np.random.random((10,2))
D = scipy.spatial.distance.cdist(Z,Z)
print(D)
```

Question:	Question:	Question:
54. How to read the following file? (★★☆)	55. What is the equivalent of enumerate for numpy arrays? (★★☆)	56. Generate a generic 2D Gaussian-like array (★★☆)
Question: 57. How to randomly place p elements in a 2D array? (★★☆)	Question: 58. Subtract the mean of each row of a matrix (★★☆)	Question: 59. How to I sort an array by the nth column? (★★☆)
Question: 60. How to tell if a given 2D array has null columns? (★★☆)	Question: 61. Find the nearest value from a given value in an array (★★☆)	Question: 62. Considering two arrays with shape (1,3) and (3,1), how to compute their sum using an iterator? (★★☆)

```
Answer 56:
                                                      Answer 55:
                                                                                                           Answer 54:
Z = np.arange(9).reshape(3,3)
                                                                                                           Z = np.arange(10, dtype=np.int32)
                                                     from io import StringIO
                                                                                                           Z = Z.astype(np.float32, copy=False)
for index, value in np.ndenumerate(Z):
    print(index, value)
                                                                                                           print(Z)
                                                     # Fake file
                                                     s = StringIO("""1, 2, 3, 4, 5\n
for index in np.ndindex(Z.shape):
    print(index. Z[index])
